Express Mail Label No.

APPLICATION ELEMENTS

See MPEP chapter 600 concerning utility patent application contents.

ADDRESS TO:

Assistant Commissioner for Patents
Box Patent Application
Washington, DC 20231

1. ☒ Fee Transmittal Form
(Submit an original, and a duplicate for fee processing)

2. ☒ Specification Total Pages 46

3. ☒ Drawing(s) (35 USC 113) Total Sheets 6

4. ☒ Oath or Declaration Total Pages 2

a. ☐ Newly executed (original or copy)

b. ☐ Unexecuted for information purposes

c. ☒ Copy from a prior application (37 CFR 1.63(d))
(for continuation/divisional with Box 17 completed)
[Note Box 5 below]

i. ☐ DELETION OF INVENTOR(S)
Signed Statement attached deleting
inventor(s) named in the prior application,
see 37 CFR 1.63(d)(2) and 1.33(b).

5. ☒ Incorporation By Reference (useable if Box 4c is checked)
The entire disclosure of the prior application, from which a copy of
the oath or declaration is supplied under Box 4c, is considered as
being part of the disclosure of the accompanying application and is
hereby incorporated by reference therein.

6. ☐ Microfiche Computer Program (Appendix)

7. Nucleotide and/or Amino Acid Sequence Submission
(if applicable, all necessary)

a. ☐ Computer Readable Copy

b. ☐ Paper Copy (identical to computer copy)

c. ☐ Statement verifying identity of above copies

ACCOMPANYING APPLICATION PARTS

8. ☐ Assignment Papers (cover sheet & document(s))

9. ☐ 37 CFR 3.73(b) Statement (when there is an assignee) ☐ Power of Attorney

10. ☐ English Translation Document (if applicable)

11. ☒ Information Disclosure Statement (IDS)/PTO-1449 ☐ Copies of IDS Citations

12. ☒ Preliminary Amendment

13. ☒ Return Receipt Postcard (MPEP 503)
(Should be specifically itemized)

14. ☐ Small Entity Statement(s) ☐ Statement filed in prior application
Status still proper and desired

15. ☐ Certified Copy of Priority Document(s)
(if foreign priority is claimed)

16. ☐ Other: _____

17. If a CONTINUING APPLICATION, check appropriate box and supply the requisite information:

☐ Continuation ☒ Divisional ☐ Continuation-in-part (CIP) of prior application No. 08/706,491

PRELIMINARY AMENDMENT

Sir:

Prior to examination on the merits of the above-identified patent application, please amend this application as follows:

IN THE CLAIMS:

Please cancel Claims 1-23 without prejudice or disclaimer of the recited subject matter.

Please add new Claims 24-53 as follows:

a step of judging the money information input from said input means and outputting a permission signal for permitting a use of information provided by an information provider; and

a step of changing the money information based on a result of judging said judging means.

29. A method according to Claim 28, wherein said judging step judges the money information in accordance with the money information and use charge information added to the provided information.

30. A method according to Claim 28, wherein said money information is cash.

31. A method according to Claim 28, wherein said money information is recorded in a recording medium.

32. A method according to Claim 28, further comprising communication means for transmitting use information of the provided information.

00335001 10010000

33. A communication method comprising:

a step of providing information including first money information from an information provider terminal;

a step of receiving and using information provided by said information provider terminal and second money information; and

a step of comparing the first money information and the second money information, outputting a permission signal for permitting a use of the information provider terminal according to a result of the comparison, and altering the second money information.

34. A method according to claim 33, wherein said comparing step judges the money information in accordance with the money information and use charge information added to the provided information.

35. A method according to Claim 33, wherein said money information is cash.

36. A method according to Claim 33, wherein said money information is recorded in a recording medium.

37. A method according to Claim 33, further comprising a communication step of transmitting use information of the provided information.

38. A method according to Claim 37, further comprising a charge distributor step of transmitting charge distribution information to said information provider terminal in accordance with the use information.

39. A method according to Claim 37, further comprising a charge accommodating step of performing accommodation of a use charge of the provided information in accordance with the use information.

40. A method according to Claim 33, wherein cipher communication is performed between said terminals.

41. A method for accounting, comprising the steps of:

inputting first data indicating an amount of money;
inputting second data regarding information
subscribed from an information provider to a terminal via
network;

judging whether a use of the information at the
terminal can be permitted or not, in accordance with the
first and second data; and

indicating the judgment result of a use permission.

42. A method according to Claim 41, wherein said second data includes a use charge, and said judging step judges a use permission of the information by comparing the amount of money and the use charge.

43. A method according to Claim 41, wherein said first data includes data indicating the type of a recording medium in which said first data is recorded, and said judging step judges a use permission of the information in accordance with the data indicating the type.

44. A method according to Claim 41, further comprising a step of rewriting the amount of money in response to a judgment operation of said judging step.

45. A method according to Claim 41, further comprising a step of outputting a use state of the information to the external of the device in response to a judgment operation of said judging step.

46. A program storage medium readable by a computer, tangibly embodying a program of instructions executable by the computer to perform an accounting method, said method comprising the steps of:

inputting money information indicating an amount of money recorded on a recording medium;

judging the money information inputted in said input step and outputting a permission signal for permitting a use of information provided by an information provider; and changing the money information based on a result of judging in said judging step.

47. A program storage medium according to Claim 46, wherein said recording medium includes a card-type recording medium.

48. A program storage medium according to Claim 47, wherein said card-type recording medium includes a pre-paid card.

49. An accounting program storage medium readable by a computer, comprising the following steps of:

obtaining first data indicating a first amount of money;

obtaining second data indicating a second amount of money regarding an information provided from an information provider;

judging whether a use of the information can be permitted or not, in accordance with the first and second data;

rewriting the amount of money in the first data
based on the judgment operation, and
notifying the judgment result of a use permission.

50. An accounting program storage medium readable
by a computer, comprising following steps of:

obtaining first data indicating a first amount of
money recorded on a recording medium;

obtaining a second data indicating a second amount
of money regarding an information subscribed from an
information provider via network;

judging whether a use of the information can be
permitted or not, in accordance with the first and second
data;

rewriting the amount of money in the first data
based on the judgment operation, and
notifying the judgment result of a use permission.

51. A transaction system comprising:

a plurality of information providers which provide
information with a price data of the information,

a plurality of terminal devices which obtain a
money data recorded on a recording medium and the information
with the price data, in which the money data is compared with
the price data to judge if the money amount is plenty of
money for use the information, the device rewrites the money

data based on a use of the information and outputs the price corresponding to the use information,

an administrative terminal which sums up the price outputted from the terminal device for each information and notifies results of summing up for each information respectively to the information providers which provides the information.

52. A transaction system according to Claim 51, wherein said information providers, said terminal devices and said administrative terminal are connected via network.

53. A transaction system according to Claim 51, wherein said recording medium is a pre-paid card.--.

REMARKS

This is a divisional application of prior Application No. 08/706,491. Claims 24-53 are pending in the application. Claims 1-23 have been cancelled without prejudice. Claims 24-53 have been newly-added. Claims 24, 28, 33, 41, 46, 49, 50 and 51 are independent. An early and favorable action on the merits is respectfully requested.

Applicant's undersigned attorney may be reached in our Washington, D.C. Office by telephone at (202) 530-1010. All correspondence should be directed to our below-listed address.

Respectfully submitted,

Attorney for Applicant

ACCOUNTING APPARATUS, INFORMATION RECEIVING APPARATUS,
AND COMMUNICATION SYSTEM

BACKGROUND OF THE INVENTION

5 Field of the Invention

 The present invention relates to an accounting
apparatus, an information receiving apparatus, and a
communication system used in a multimedia network or
the like in which transferred is information including
10 moving image data, still image data, voice data,
computer data, computer program and the like, and
particularly features in information provision and its
accounting system.

Related Background Art

15 In the field of trunk communication networks,
optical fiber networks have been consolidated, cable
television systems have been developed, satellite
communications have been used practically, and local
area networks have been prevailed. Various types of
20 information is provided by using such communication
networks. Information service industries are becoming
large which charge a toll in accordance with the
quantity and contents of information. It is important
for such industries to properly charge a toll of
25 provided information.

 Protection of information is not still perfect,
and there is an issue of illegal use of information

including programs, images, and voices. In order to prevent illegal use, a copy protection function is provided, a serial number check is performed, or other methods are performed. In the serial number check, a hardware serial number and a software serial number are compared with each other when each program is executed. The copy protection function is inconvenient when a backup is to be performed, and the serial number check is inconvenient for the management of serial numbers and sales.

A concept "super distribution" proposed by Ryouich Mori aims at protection of rights of a software proprietor (hereinafter called an information provider). This concept was embodied in Japanese Patent Application Laid-open Nos. 60-77218, 60-191322, 64-68835, 2-44447, 4-64129, and others. Fig. 1 illustrates the concept "super distribution" disclosed in Japanese Patent Application Laid-open No. 4-64129. An information provider P supplies proprietary software PPi (or PPj) to a user terminal station 10. The user terminal station 10 includes a discrimination or judging unit 11 and a storage unit 12. The discrimination unit 11 judges whether or not the software PP is permitted to use, by comparing a software identification number PIDI (or PIDj) with a user ID/condition. If usable, a use history of provided information is stored in the storage unit 12.

The information provider P charges a toll of provided information (software PP) in accordance with the use history. Reference numeral "13" denotes a software service unit (SSU) including the above-described
5 unites.

The "super distribution" system is, however, associated with the following problems.

(1) In the "super distribution" system, whether a user is a subscriber to an information provider is
10 judged from data specific to the user such as a user ID. It is therefore necessary to prepare at least a storage unit for storing the data specific to users. Each user first asks for the information provider so as to receive a use permission and a user ID or the like,
15 and then the user ID or the like is stored as the user specific data. Such a subscriber permission procedure is cumbersome and the management of specific data of a number of users requires much labor.

(2) In the "super distribution" system, the
20 storage unit 12 for storing software use history is used for preventing illegal use of information and for managing the use state of information provided by the information provider. In accordance with the use history, the information provider asks for the user to
25 pay a charge. In the "super distribution" system, information is not sold but rent so that the use history becomes necessary. However, with this system,

the information provider knows the information provided to a user and privacy of the user cannot be protected.

(3) With the "super distribution" system, although the use state and charges of provided information can be correctly managed, a charge payment apparatus and method is not disclosed. Therefore, after the information provider checks the use state of provided information, the provider is required to ask for a charge and receive it by using another system.

SUMMARY OF THE INVENTION

It is an object of the present invention to solve the above problems (1) to (3).

It is another object of the present invention to provide a novel apparatus and system for receiving information from an information provider for counter value, capable of being compatible with protection of rights of the information provider and with convenience, and protection of privacy of a user.

According to one aspect of the present invention achieving the above objects, there is provided an accounting apparatus comprising: input means for inputting money information indicating an amount of money; and judging means for judging the money information input from the input means and outputting a permission signal for permitting a use of information provided by an information provider.

According to another aspect of the present invention, there is provided a communication system comprising: an information provider terminal for providing information; a user terminal for receiving and using information provided by the information provider terminal; and an accounting unit inputted with money information and having judging means for judging the input money information, and outputting a permission signal for permitting a use of information provided by an information provider.

The above and other objects and features of the present invention will become apparent from the following detailed description of embodiments when read in conjunction with the accompanying drawings.

BRIEF DESCRIPTION OF THE DRAWINGS

Fig. 1 is a block diagram illustrating a conventional super distribution system.

Fig. 2 is a block diagram showing a charging apparatus and an information receiving apparatus according to a first embodiment of the invention.

Fig. 10 is a block diagram showing a communication system with the charging apparatus and information receiving apparatus of the sixth embodiment.

20 DETAILED DESCRIPTION OF THE PREFERRED EMBODIMENTS

Embodiments of the present invention will be described with reference to Figs. 2 to 10.

The first embodiment of the invention will be described with reference to Fig. 2.

25 In Fig. 2, reference numeral 10 represents a user's terminal station as an information receiving apparatus, P represents an information provider, PPI

(or PPj) represents information provided by the information provider P for counter value, PIDi (or PIDj) represents data added to and specific to PPI, PPC represents money information such as cash and card to be described later, reference numeral 14 represents a PPC input unit, reference numeral 15 represents a display unit, reference numeral 16 represents an accounting unit 16 including the PPC input unit 14, display unit 15 and a discrimination or judging unit 16 for judging whether or not the provided information PP is permitted to use, and reference numeral 17 represents a signal processing unit.

The operation will be described next.

The information provider P provides the information PP including PID. The user's terminal station 10 is configured so that the accounting unit 16 is always used when the provided information PP is used. The accounting unit 16 has the input unit 14 for receiving the money information PPC. When an event of using the provided information PP occurs, the discrimination unit 11 checks a use permission of the provided information PP in accordance with the PID and/or PPC. For example, it is checked whether or not a use charge contained in PID is equal to or smaller than the balance indicated by the money information PPC. A permission (OK) or a refusal (NG) is notified to the signal processing unit 17. If permitted, the

signal processing unit 17 operates so that the user can use the provided information PP. Information (a use charge toll of the provided information, a balance of PPC, and the like) on PID and PPC is displayed on the display unit 15. The use judgement result by the discrimination unit 11 may be displayed on the display unit 15.

In this invention, the money information PPC may be cash, a pre-paid card like a telephone card, electronic money information stored in a floppy disk, an IC card, or a PCMCIA card. In this invention, instead of utilizing a user ID specific to the user, the money information PPC not specific to the user is utilized in order to judge whether or not the provided information PP is permitted to use. Therefore, a user is not requested to provide a user ID. Only the money information PPC is given, i.e., only a use charge of the provided information is paid. This procedure is natural and easy. It is not necessary therefore to manage a large amount of user specific information, and so the problem (1) can be solved.

In this invention, since the user specific data is not given, privacy of using provided information cannot be supplied to the information provider. This may sound that the rights of the information provider P are not protected. However, it is sufficient if only the charge corresponding to the use occurrence frequency is

paid to the information provider P, and the privacy of using provided information is not necessary to be supplied to the information provider P. Although the invention does not use a use history storage unit for storing the information that which PID is used by a user having what ID, the invention may have a use occurrence frequency storage unit for storing the information that which information is used what times and a use notice unit for notifying a current use of provided information. In Fig. 2, use occurrence frequency is notified to the information provider P via a path indicated by a broken line. The details of the use occurrence frequency unit and use notice unit will be given in the second to sixth embodiments. The problem (2) of user privacy can therefore be solved.

In this embodiment, PPC is money information and can pay a charge by using PPC so that the problem (3) can be solved. Particular examples of how PPC can be obtained, collected, and how charges are distributed to each information provider will be described together with the problem (2) in the second to sixth embodiments.

The accounting unit 16 constitutes an accounting apparatus of this invention. Although the accounting unit 16 is provided integrally with the user's terminal station 10, this may be provided separately from the user's terminal station 10. In this case, the

accounting unit 16 first receives the information PID added to the information PP provided by the information provider P, and in response to a signal indicating a permission judged based on PID and PPC by the discrimination unit 11, the user terminal 10 is permitted to receive the provided information PP and to process signals. This arrangement may also be applied to the second to eighth embodiments to be later described.

The second embodiment will be described with reference to Fig. 3.

In the embodiment shown in Fig. 3, PPC is cash. In this case, the input unit 14 has an inlet of a coin and paper currency. A user first inputs a certain amount of money to the input unit 14. If the input money exceeds the charge indicated by PID, the discrimination unit 11 permits to use the provided information PP. In an alternative structure, the accounting unit 16 displays a use charge of the provided information on the display unit 15, and the user inputs a corresponding money to the input unit 14. In accordance with the input money, the discrimination unit 11 checks whether or not the provided information PP can be permitted to use. In a further alternative structure, if a charge is changed with a use time, this effect is displayed and an additional charge is input. The input money is stored in a coin box 18 and is

collected by the information provider or some other bodies which collect money. A use occurrence frequency of each piece of provided information PP is recorded by a counter 19, and the collected charges in the coin box 18 are distributed to each information provider P in accordance with the use occurrent frequencies. If only one piece of provided information PP is used and a use occurrence frequency is not necessary to be counted, the counter 19 may be omitted.

Next, the third embodiment will be described with reference to Fig. 4.

In the third embodiment shown in Fig. 4, PPC is a pre-paid card such as a telephone card. A user inserts a pre-paid card into the PPC input unit 14. The discrimination unit 11 judges whether or not the money recorded in the pre-paid card is larger than the use charge, and if larger, use of PP is permitted. In this example, the use charge is displayed on the display unit 15. In this embodiment, the discrimination unit 11 and PPC input unit 14 are structured so that, even if the use charge of PP is changed with time, if the charge is smaller than the money recorded in the pre-paid card, PP can be used continuously. If the input unit 14 is structured so as to allow an additional pre-paid card to be inserted, PP can be used for a longer time period.

Such a pre-paid card can be easily bought from one

of pre-paid card retail shops like as in the case of telephone cards. The manufacturer of pre-paid cards is a charge distributor 20. Each information provider is registered to the charge distributor 20 and receives
5 charges in accordance with a use occurrence frequency of provided information PP. The charge distributor 20 includes pre-paid card retail shops.

Distribution of charges corresponding to use occurrence frequencies is realized by notifying current
10 use information from the accounting unit 16 to the charge distributor 20 via a communication I/F 21. This use notice is issued only when the accounting unit 16 changes the money recorded in the pre-paid card. If the provided information PP is received via
15 communications, this communication I/F 21 can be shared. In this case, as shown in Fig. 5, a terminal of the charge provider 20, a terminal of the information provider P, and the user's terminal 10 are connected to a network 22. The charge distributor 20
20 distributes charges to information providers P in accordance with the above-described notice.

If the communication I/F 21 is not used, a pre-paid card different for each piece of provided information may be used. In this case, the
25 discrimination unit 11 checks the type of each pre-paid card and judges whether or not the provided information can be permitted to use. Alternatively, the accounting

unit 16 may be provided with means for recording a use of provided information PP in a pre-paid card. In this case, the charge distributor 20 collects pre-paid cards and distributes charges in accordance with use
5 occurrence frequencies. In order to promote collection of pre-paid cards, the following system may be incorporated. Namely, if a new pre-paid card is bought by replacing it by the old pre-paid card, only the money recorded in the new-pre-paid card is paid,
10 whereas if a new pre-paid card is not bought, a charge only for the pre-paid card itself is paid. Charges used by pre-paid cards not collected may be distributed in accordance with ratios of charges used by pre-paid cards already collected.

15 Fig. 6 shows the fourth embodiment in which PPC is a floppy disc or an electronic and/or magnetic storage device easy to be rewritten. The network system using the fourth embodiment is shown in Fig. 7.

Money information stored in PPC is specific data
20 certified by banks or other financial bodies or allowed to add money information only by the charge distributor 20 including retail shops. A user inserts a PPC into the input unit 14. The accounting unit 16 reads money information from PPC, and if the read money information
25 is larger than the charge recorded in PID which may be displayed and if the accounting unit 16 can claim payment from PPC, then the discrimination unit 11

permits to use PP. In this case, even if the use charge is changed with time, the provided information PP can be used continuously so long as the charge is smaller than the money information recorded in PPC.

- 5 Since the money information is electronic money information, the charge distributor 20 can input or output the money information via the communication I/F in accordance with a predetermined procedure.
- 10 Different from the first and second embodiments, a user does not pay cash to the charge distributor 20. Insurance of payment by a user is made by banks or other financial bodies (hereinafter called a charge accommodation person 23) contracted with the user.
- 15 Similar to the third embodiment, current use information is notified to the charge distributor 20 via the communication I/F 21 to distribute charges in accordance with use occurrence frequencies. In this case, a use charge may be sent directly to the charge distributor 20 or information provider by using the
- 20 electronic money information PPC.

- Specifically, input/output of the electronic money information can be achieved by the following communication procedure. It is assumed here that the accounting unit 16 has code/certification means to be
- 25 described later and means for security management of time stamps represented by TA to be described later. These means are provided for the certification of PPC

and prevention of illegal copy or the like of PPC under the management of time stamps, because PPC is a medium such as a floppy disk easy to be rewritten.

The accounting or charging process will be described assuming that each of a user "A", information provider "B", charge distributor "C", and charge accommodating person "D" has a secret key capable of signature and a communication partner has a public key capable of inspection of the signature, where the secret key of "A" is represented by "sA", and the public-key of "A" is represented by "pA". Consider now that "A" uses information P_i provided by "B". The process result by "X" using a key "Y" is represented by $\{X\} \sim Y$ and the management of each process of a user, a key, and time stamps is assumed to be made by means provided in the accounting unit 16 and having certified security, or by a memory or record of the user.

Money Information Input Process

(1) "A" sends an input request message MA for money information of a yen (money denomination is not limited only to yen) to "C", by adding registration information "iA" of "A" (such as account number and credit number) and with a signature by the secret key "sA".

$$MA = \{A, \{A, iA, a, TA\} \sim sA\}$$

(2) "C" inspects the signature of MA by using the public key of "A", and claims payment of "a" yen to "D"

by using the registration information "iA". If the payment is acknowledged, "C" sends the following message MC to "A" with a signature by the secret key "sC" of "C" for each yen of the money information "a" or for each basic unit "c" (for each 100 yen if the provided information has a charge in the unit of 100 yen). Each yen or each basic unit is added with a different time stamp TCi.

$$MC = E\{TA, \{C, e, TCi\} \wedge sC\} \wedge pA$$

(3) "A" decodes each of MC by using "pA" and inspects the signature by the public key pC of "C" corresponding to "sC". If the inspection shows a correct signature, $\{C, a, TCi\} \wedge sC$ is written in PPC.

TA and TCi indicate a time stamp. A message having the same time stamp of the same transmitter is judged as an illegal request. TA and TCi may not be a time stamp, but may be a serial number or a random number with no or less coincidence between random numbers.

Use Information Notice Process

(1) If "A" wants to use information Pi, the accounting unit 16 permits to use Pi on the assumption that the money information in PPC of "A" is larger than the charge recorded in PIDi.

(2) After "A" terminates the use of Pi or during the use, the accounting unit 16 erases the required

charge from the money information PPC.

(3) At this time, "A" sends the following use message MB to "C" where "b" is the erased use charge.

$MB = \{A, B, \{B, b, TB\} \sim sA\}$

5 (4) "C" inspects this message and if correct, "b" yen is paid as distributed money to "B".

In the above description, a public key cryptosystem is used between "C" and each user in order to simplify the process. Obviously, a common key cryptosystem using a common key may be used. The effective term of each message may be determined from a lapse time from a time stamp. In the above description, the order of data element in each message may be irregular, and in some cases an ID number of a user A, B,... and time stamps are not always necessary. The above money information input process and use information notice process are only illustrative, and the accounting process by electronic money information without using data specific to a user falls within the scope of the invention.

10

15

20

If the communication I/F is not provided, a user goes to the charge distributor 20 including retail shops and pays money corresponding to the money information stored in PPC to thereby obtain the money information. Charges can be distributed in accordance with use occurrence frequencies by collecting the use record in PPC of the provided information PP recorded

25

by the accounting unit 16 as in the case of the message MB, when the user goes to the charge distributor 20 including retail shops to supplement the money information. As above, since the electronic money information is specific data capable of being processed only by the charge distributor 20, the user having no communication I/F 21 is required by all means to go to the charge distributor 20 including retail shops in order to change the contents of PPC. Therefore, the use record can be collected and charges can be distributed in accordance with use occurrence frequencies.

Fig. 8 shows the fifth embodiment in which PPC is an electronic card such as an IC card and a PCMCIA card. The structure of the network system using the fifth embodiment is the same as that shown in Fig. 7. Money information stored in PPC is specific data certified by banks or other financial bodies or allowed to add money information only by the charge distributor 20 including retail shops. A user inserts a PPC into the input unit 14 to activate PPC by a predetermined process (such as inspection of a password). The accounting unit 16 reads money information from PPC, and if the read money information is larger than the charge recorded in PID which may be displayed and if the accounting unit 16 can claim payment from PPC, then the discrimination unit 11 permits to use PP. In this

case, even if the use charge is changed with time, the provided information PP can be used continuously so long as the charge is smaller than the money information recorded in PPC.

5 Since the money information is electronic money information, the charge distributor 20 can input or output the money information via the communication I/F 21 in accordance with a predetermined procedure. Different from the first and second embodiments, a user
10 does not pay cash to the charge distributor 20. Insurance of payment by a user is made by banks or other financial bodies, i.e., by the charge accommodation person 23 contracted with the user. Similar to the third embodiment, current use
15 information is notified to the charge distributor 20 via the communication I/F 21 to distribute charges in accordance with use occurrence frequencies. In this case, a use charge may be sent directly to the charge distributor 20 or information provider P by using the
20 electronic money information PPC.

 Specifically, input/output of the electronic money information can be achieved by the following communication procedure. It is assumed here that for the purpose of security of communications and
25 processes, a user of the electronic card used as PPC can be confirmed by a password, an access to the data memory of PPC can be controlled by the access

condition, and the cryptosystem can perform cipher and certification operations to be described later. It is also assumed that a secret key used for cipher and certification is written in the access controlled memory region and only a person (card issuing person, charge distributor, and the like) satisfying the access condition can only access. It is assumed that the following charging operations cannot be changed except by the card issuing person or charge distributor 20.

5 The user's terminal station 10, the terminal of the information provider P, the terminal of the charge distributor 20, and the terminal of the charge accommodating person 23 are connected to the network 22 as shown in Fig. 7. A user is represented by "A", an information provider is represented by "B", a charge distributor is represented by "C", and a charge accommodating person is represented by "D". "C" has secret keys for cipher communications to each user (e.g., a secret key "sA" between "A" and "C", a secret key "sB" between "B" and "C") and a secret key "sC" known only by "C" and a corresponding inspection key "pC" for signature is made public. Consider now that "A" uses information P_i provided by "B". The cipher sentence of a plain sentence "X" using a key "Y" is represented by $\{X\}^Y$ and each process of a user is assumed to be performed in PPC having a security function.

Money Information Input Process

(1) "A" sends an input request message MA for money information of a yen (money denomination is not limited only to yen) to "C", by adding registration information "iA" of "A" to "D" (such as account number and credit number).

$$MA = \{A, \{A, iA, a, TA\} \wedge sA\}$$

(2) "C" deciphers the enciphered portion of MA by using the shared "sA" and claims payment of "a" yen to "D" by using "iA". If the payment is acknowledged, "C" gives the money information "a" a signature by using the signature key "sC" and sends the following message to "A".

$$MC = \{TA, \{C, a, TC\} \wedge sC\} \wedge sA$$

(3) "A" deciphers MC by using "sA" and inspects the signature by the public key pC of "C" corresponding to "sC". If the inspection shows a correct signature, the money information of "a" yen is added to PPC.

TA and TCi indicate a time stamp. A message having the same time stamp of the same transmitter is judged as an illegal request. TA and TC may not be a time stamp, but may be a serial number or a random number with no or less coincidence between random numbers.

25 Use Information Notice Process

(1) If "A" wants to use information Pi, the accounting unit 16 permits to use Pi on the assumption

that the money information in PPC of "A" is larger than the charge recorded in PIDi.

(2) After "A" terminates the use of Pi or during the use, the accounting unit 16 subtracts the required charge from the money information PPC and the result is written in PPC.

(3) At this time, "A" sends the following use message MB to "C" where "b" is the subtracted use charge.

10 $MB = \{A, \{B, b, TB\} \wedge sA\}$

(4) "C" deciphers this message and if correct, "B" yen is paid as distributed money to "B".

If information is transferred between "A" and "B" by using cipher, the following processes are performed between the money information input process and use information notice process. It is assumed that "C" shares a secret key also with the information provider "B".

Information Use Process

20 (1) "A" sends the following message MA' to "C" to ask for the generation of a speech key with "B".

$MA' = \{A, B, TA'\}$

(2) "C" generates the speech key CK and sends the following message MC' to "A".

25 $MC' = \{\{TC', A, CK\} \wedge sB, TA', B, CK\} \wedge sA$

(3) "A" deciphers MC' by using "sA" and sends $\{TC', A, CK\} \wedge sB$ to "B".

(4) "B" deciphers the received message by using "sB" and information enciphered with the speech key CK is sent to "A".

(5) "A" deciphers the enciphered information using the speech key CK.

In the above description, a common key cryptosystem is used between "C" and each user in order to simplify the process. Obviously, a public key cryptosystem may be used similar to the fifth embodiment. The effective term of each message may be determined from a lapse time from a time stamp. In the above description, the order of data element in each message may be irregular, and in some cases an ID number of a user A, B,... and time stamps are not always necessary. The above money information input process and use information notice process are only illustrative, and the accounting process by electronic money information without using data specific to a user falls within the scope of the invention.

If the communication I/F is not provided, a user goes to the charge distributor 20 including retail shops to make the money information be written in PPC. Charges can be distributed in accordance with use occurrence frequencies by collecting the use record in PPC of the provided information PP recorded by the accounting unit 16, when the user goes to the charge distributor 20 including retail shops to supplement the

money information. As above, since the electronic money information is specific data capable of being processed only by the charge distributor 20, the user having no communication I/F 21 is required by all means to go to the charge distributor 20 including retail shops in order to change the contents of PPC. Therefore, the use record can be collected and charges can be distributed in accordance with use occurrence frequencies.

Fig. 9 shows the sixth embodiment in which similar to the fifth embodiment, electronic information is used for the money information and the charge distributor 20 is not necessary.

The user's terminal station 10, the terminal of the information provider P, and the terminal of the charge accommodating person 23 are connected to the network 22 as shown in Fig. 9. It is assumed here that a user of the electronic card used as PPC can be confirmed by a password, an access to the data memory of PPC can be controlled by the access condition, and the cryptosystem can perform cipher and certification operations. It is also assumed that a secret key used for cipher and certification operations is written in the access controlled memory region. It is assumed that the following accounting operations cannot be changed except by the card issuing person.

A user is represented by "A", an information

provider is represented by "B", and a charge
accommodating person is represented by "D". It is
assumed each has a secret key capable of signature and
the communication partner knows the public key capable
5 of inspecting signature (e.g., a secret key "sA" of "A"
and the public key "pA" of "A"). Consider now that "A"
uses information Pi provided by "B". The process
result by "X" using a key "Y" is represented by $\{X\} \wedge Y$
and each process of a user is assumed to be performed
10 in PPC having a security function.

Money Information Input Process

(1) "A" sends an input request message MA for
money information of a yen (money denomination is not
limited only to yen) to "D", by adding registration
15 information "iA" of "A" (such as account number and
credit number).

$$MA = \{A, \{A, iA, a, TA\} \wedge sA\}$$

(2) "D" inspects the signature of MA by using the
public key "sA" of "A", and if "iA" is correct and "A"
20 can pay "a" yen, gives the money information "a" a
signature, and sends the following message to "A".

$$MD = \{TA, \{D, a, TD\} \wedge sD\} \wedge sA$$

(3) "A" inspects MD by using "pA" and inspects the
signature by the public key pD of "D" corresponding to
25 "sD". If the inspection shows a correct signature, the
money information of "a" yen is added to PPC.

TA and TD indicate a time stamp. A message having

the same time stamp of the same transmitter is judged as an illegal request. TA and TD may not be a time stamp, but may be a serial number or a random number with no or less coincidence between random numbers.

5 Use Information Notice Process

(1) If "A" wants to use information P_i , the accounting unit 16 permits to use P_i on the assumption that the money information in PPC of "A" is larger than the charge recorded in PID_i .

10 (2) After "A" terminates the use of P_i or during the use, the accounting unit 16 subtracts the required charge from the money information PPC and the result is written in PPC.

15 (3) At this time, "A" sends the following use message MB to "B" where "b" is the subtracted use charge.

$$MB = \{A, B, \{B, b, TB\} \wedge sA\}$$

20 (4) "B" inspects the signature and if correct, receives "b" yen by showing the signature of "A" $\{B, b, TB\} \wedge sA$ to "D".

If information is transferred between "A" and "B" by using cipher, although cipher communication can be performed directly by using the partner public key, if the amount of information is large, the cipher communication using the common key may be performed as in the following. In the following processes (1) and (2), "A" and "B" may be interchanged.

Information Use Process

(1) "A" sends the common key CK with "B" by enciphering with the public key "pB" of "B".

$$MA' = \{A, B, CK, TA'\} \wedge pB$$

(2) "B" decipheres the received message by using "sB".

(3) "B" sends information ciphered by using the common key CK to "A".

(4) "A" decipheres the received information by using the common key CK.

In the above description, a public key cryptosystem is used between "D", each user, and the information provider P for the purpose of simplicity. Obviously, the common key cryptosystem may be used.

The effective term of each message may be determined from a lapse time from a time stamp. In the above description, the order of data element in each message may be irregular, and in some cases an ID number of a user A, B, ... and time stamps are not always necessary.

The above money information input process and use information notice process are only illustrative, and the accounting process by electronic money information without using data specific to a user falls within the scope of the invention.

Next, other embodiments will be described.

Seventh Embodiment

The accounting unit of the second embodiment using

cash may be applied to an accounting system having one or more user's terminal stations. This accounting system may be installed by the information provider P or charge distributor 20 at locations where a number of people gather, such as a public telephone booth, a game center, a tea shop, and a library. People can receive information by paying cash.

The accounting unit of the third embodiment using a pre-paid card may be applied to an accounting system wherein the information provider P widely distributes information PP by means of CD-ROMs, personal computer communications or the like, the charge distributor 20 may be some copyright association which manufactures and sells pre-paid cards, and a user buys the pre-paid card at a retail shop or the like to receive provided information PP at home or other terminals.

The accounting unit of the fourth embodiment using a floppy disk may be applied to an accounting system wherein a specific PPC input unit 14 such as used by the third embodiment is not necessary because the user's terminal station is generally equipped with a floppy disk input unit 14, retail shops are not necessary because the money information can be given through communications, and the cipher and certification operations are performed by using software. This accounting system can be easily realized by using current network systems.

The accounting unit of the fifth embodiment using an electronic card such as an IC card and a PCMCIA card may be applied to an accounting system whose security function is more reliable than the accounting system using the fourth embodiment.

The accounting unit of the sixth embodiment may be applied to an accounting system wherein the charge distributor 20 is not necessary and the user and information provider P contract directly through the charge accommodating person 23. The accounting unit and accounting system is obviously applicable to an electronic money using specific data which is expected to be practically used in near future.

The scope of the invention also includes combinations of accounting units and accounting systems.

Eighth Embodiment

In a presently known accounting scheme, an information provider stores a plurality set of information enciphered by different keys in a CD-ROM. A CD-ROM itself is sold at a low price at a retail shop. If a user requests some information, the information provider teaches a cipher key of that information and receives some charge. With this scheme, however, a retail shop receives a fraction of sales profit of CD-ROM excepting a charge of provided information.

This problem can be solved by using the PPC accounting unit of this invention not as renting the information but as selling it. Specifically, a user buys both a CD-ROM and PPC such as a pre-paid card.

5 The pre-paid card is used when an encipher key is taught from the information provider via communications (telephone or the like). The information provider receives the charge from the retail shop. In this manner, the retail shop can gain some profits also from

10 the provided information. In this case, the accounting unit 16 checks the PPC money information and if a use of the provided information is permitted, it subtracts the use charge from PPC when the information is deciphered. If PPC is not used, the money can be paid

15 back. PPC is manufactured by each provider and sold at retail shops like CD-ROM.

In this system, the charge distributor 20 is not necessary. If the use information notice process of the third embodiment is modified in the following

20 manner, this process for a pre-paid card can provide higher security. It is however assumed that each pre-paid card is provided with an ID number "iP" and a corresponding secret key "sP".

Use Information Notice Process

25 (1) If the money information in PPC of "A" is larger than the charge indicated in PIDI, the discrimination unit permits to use the information Pi.

(2) After "A" terminates the use of P_i or during the use, the discrimination unit subtracts the required charge from the money information PPC and the result is written in PPC.

5 (3) At this time, the discrimination unit sends the following use message MB to "C" where "b" is the subtracted use charge for "B".

MB = {iP, {B, b, iP, TB} ^ sP}

10 (4) "C" deciphers MS by using the registered secret key "sP" and if correct, pays "b" yen as the distributed charge to "B".

In the above manner, the use message cannot be generated except a person knowing both "iP" and "sP".

15 Next, the secret key cryptosystem and public key cryptosystem will be described.

20 The secret key cryptosystem is a cryptosystem (also called a secret key cryptosystem, a symmetry cryptosystem, and a common use cryptosystem) in which a transmitter and a receiver share the same secret key.

25 The secret key cryptosystem may be classified into a block cipher and a stream cipher, the former enciphering a proper length character string (block) with the same key and the latter enciphering each character string or bit with a different key. The block cipher includes a replacement cipher enciphering by replacing the order of characters and a character change cipher enciphering by changing a character to a

different character. In these cases, a correspondence table of replacement and character change is used as the encipher key.

Known stream ciphers include a Vigenere cipher using a multi-table and a Vernam cipher using a one-time disposed key (the details of each cipher are referenced to Ikeno and Koyama "Modern Cipher Theory", IEICE, 1986, second and fourth paragraphs). Of the block ciphers, DES (Data Encryption Standard) and FELA (Fast Data Encipherment Algorithm) are widely used as commercial ciphers because their algorithms are made public (the details are referenced to Tsujii and Kasahara "Cipher and Information Security", Shoukoudo, 1990, second paragraph).

Since the algorithms of DES and FELA are made public, they are modified in various ways in order to prevent deciphering. For example, the number of repetitions to be described later is increased (refer to C. H. Mayer and S. M. Matyas "CRYPTOGRAPHY - A New Dimension in Computer Data Security", Willey-Interscience, Appendix D, pp. 679 to 712, 1982) and a key is changed frequently (refer to Yamamoto, Iwamura, Matsumoto, and Imai "Square Type Quasi Random Number Generator and Practical Ciphering with Block Cipher", Technical Report, IEICE, ISEC93-29, pp. 65 to 75, 1993).

Public Key Cryptosystem

In the public key cryptosystem, an encipher key and a decipher key are different, the former being made public and the latter being maintained in secret. The feature (a), protocol (b), and typical examples (c).

5 (a) Feature of Public Key Cipher

(1) Since the encipher key and decipher key are different and the encipher key is made public, it is not necessary to send the encipher key in secret and so facilitate a despatch.

10 (2) The encipher key of each user is made public so that each user is required only to keep its decipher key in secret.

(3) A certification function can be achieved by which a receiver can confirm that the received communication text is not forged nor modified.

15 (b) Protocol of Public Key Cipher

The algorithm of a public key satisfies the following two conditions, wherein a communication sentence is represented by M , the enciphering with the public encipher key " k_p " is represented by $E(k_p, M)$, and the deciphering with a secret decipher key " k_s " is represented by $D(k_s, M)$.

(1) When " k_p " is given, calculation of $E(k_p, M)$ is easy. When " k_s " is given, calculation of $D(k_s, M)$ is easy.

(2) If "ks" is unknown, it is difficult to determine M from the viewpoint of the calculation amount even if "kp", the calculation procedure of E, and $C = E(kp, M)$ are known.

5 If the following condition (3) in addition to the conditions (1) and (2) is satisfied, secret communications can be realized.

10 (3) For all communication texts (plain texts) M, it is possible to define $E(kp, M)$ and the condition of $D(ks, E(kp, M)) = M$ is satisfied. Namely, since "kp" is made public, anyone can calculate $E(kp, M)$. However, only a person having the secret key "ks" can obtain M by calculating $D(ks, E(kp, M))$. If the following condition (4) in addition to the conditions
15 (1) and (2) is satisfied, certification communications can be realized.

20 (4) For all communication texts (plain texts) M, it is possible to define $D(ks, M)$ and the condition of $E(kp, D(ks, M)) = M$ is satisfied. Namely, only a person having the secret key "ks" can calculate $D(ks, \bar{M})$. Even if another person calculates $D(ks', M)$ by using a forged secret key ks' , the receiver can confirm that the information was forged because $E(kp, D(ks', M))$ becomes different from M. Even if $D(ks, M)$ is
25 forged, $E(kp, D(ks, M)')$ becomes different from M and the receiver can confirm that the received information was forged.

In the public key cryptosystem, the process E using the public key is called enciphering, and the process D using the secret key is called deciphering. For the secret communications, the transmitter performs enciphering, and then the receiver performs deciphering. For the certification communications, the transmitter performs deciphering, and then the receiver performs enciphering.

The protocols will be explained where in a transmitter "A" uses a public key cipher and performs secret communications, certification communications, secret communications with signature, relative to the receiver "B". The secret key of "A" is represented by "ksA" and the public key of "A" is represented by "kpA", whereas the secret key of "B" is represented by "ksB" and the public key of "B" is represented by "kpB".

Secret Communications

Secret communications of a communication text (plain text) from "A" to "B" is performed by the following procedure.

Step 1: "A" enciphers M by using the public key "kpB" of "B" and sends the enciphered text C to "B".

$$C = E(kpB, M)$$

Step 2: "B" decipheres C by using the secret key "ksB" of "B" to obtain the original plain text M.

$$H = D(ksB, C)$$

Since the public key of the receiver "B" is made public, any person not limited to "A" can have secret communications with "B".

Certification Communications

5 Certification communications of a communication text (plain text) from "A" to "B" is performed by the following procedure.

Step 1: "A" generates a transmission text S by using the secret key "ksA" of "A" and sends it to "B".

10 $S = D(ksA, M)$

This transmission text is called a signature text and the operation of generating the signature sentence is called signature.

15 Step 2: "B" deciphers S by using the public key "kpA" of "A" to obtain the original plain text.

$M = E(kpA, S)$

If it is confirmed that M is a text having some meanings, it is certified that M has been transmitted from "A".

20 Since the public key of the transmitter "A" is made public, any person not limited to "B" can certify the signature text of "A".

Such certification is also called digital signature.

25 Certification Communications with Signature

Certification communications with signature of a communication text (plain text) from "A" to "B" is

performed by the following procedure.

Step 1: "A" generates a signature text S through signature of S by using the secret key "ksA" of "A".

$$S = D(kpA, M)$$

5 "A" further enciphers S by using the public key "kpB" of "B" and sends the enciphered text C to "B".

$$C = E(kpB, S)$$

Step 2: "B" deciphers C by using the secret key "ksB" of "B" to obtain a signature text S.

10 $S = D(ksB, C)$

"B" further deciphers S by using the public key "kpA" of "A" to obtain the original plain text M.

$$M = E(kpA, S)$$

15 If it is confirmed that M is a text having some meanings, it is certified that M has been transmitted from "A".

The sequence order of the functions at each Step of the secret communications with signature may be reversed. Specifically, Step 1: $C = E(kpB, D(ksA, M))$ and Step 2: $M = E(kpA, D(ksB, C))$ may be reversed to Step 1: $C = D(ksA, E(kpB, M))$ and Step 2: $M = D(ksB, E(kpA, C))$.

(c) Typical public key cryptosystems

25 Typical examples of public key cryptosystems are enumerated in the following.

Cryptosystems capable of secret communications and certification communications are as follow.

RSA cryptosystem: R. L. Rivest, A. Shamir and I. Adelman "A method of obtaining digital signatures and public key cryptosystems", Comm. of ACM, 1978.

5 R cryptosystem: M. Rabin "Digitalized signatures and public-key cryptosystems", MIT/LCS/TR-212, Technical Report MIT. 1979.

W cryptosystem: H. C. Williams "A modification of the RSA public-key encryption procedure", IEEE Trans. Inf. Theory, IT-26, 6, 1980.

10 MI cryptosystem: T. Matsumoto and H. Imai "New algorithm for public-key cryptosystems", Technical Report, IT-82-84, 1982, IEICE; and T. Matsumoto and H. Imai "A class of asymmetric cryptosystems based on polynomials over finite rings", IEEE International
15 Symp. on Information Theory, 1983.

Cryptosystems capable of only secret communications are as follows.

MH cryptosystem: R. C. Merkle and M. E. Hellman "Hiding information and signatures in trapdoor
20 knapsacks", IEEE Trans. Inf. Theory, IT-24, 5, 1978.

GS cryptosystem: A. Shamir and R. E. Zippel "On the security of the Merkle-Hellman cryptographic scheme", IEEE Trans. Inf. Theory, IT-26, 3, 1980.

25 CR cryptosystem: B. Chor and R. L. Rivest "A knapsack type public key cryptosystem based on arithmetic infinite field", Proc. Crypto. 84.

M cryptosystem: R. J. McEliece "A public-key

cryptosystem based on algebraic coding theory", DSN
Progress Rep. Jet Propulsion Lab. 1978.

- 5 E cryptosystem: T. E. Eicamal "A public key
cryptosystem and a signature scheme based on discrete
logarithm", Proc. Crypto. 84, 1984.

T cryptosystem: Shigeo Tsujii "A public key
cryptosystem using matrix factorization", Technical
Report, IEICE, IT8512, 1985.

- 10 Cryptosystems capable of only certification
communications are as follows.

S cryptosystem: A. Shamir "A fast signature
scheme", report MIT/LCS/TM-107, MIT laboratory for
computer science Cambridge, Mass. 1978.

- 15 L cryptosystem: K. Leiberherr "Uniform complexity
and digital signature", Lecture Notes in Computer
Science 115 Automata Language and Programming, Eighth
Colloquium Acre, Israel, 1981.

- 20 GMY cryptosystem: S. Goldwasser, S. Micali and A.
Yao "Strong signature schemes", ACM Symp. on Theory of
Computing, 1983.

GMR cryptosystem: S. Goldwasser, S. Micali and R.
L. Rivest "A paradoxical solution to the signature
problem", ACM Symp. on Foundation of Computer Science,
1984.

- 25 OSS cryptosystem: H. Ong, C. P. Schnorr and A.
Shamir "An efficient signature scheme based on
quadratic equation", ACM Symp. on Theory of Computing,

1984.

OS cryptosystem: T. Okamoto and A. Shiraishi
"Digital signature scheme based on polynomials
calculation", IEICE, (D), J86-D, 5, 1985; and T.
5 Okamoto and A. Shiraishi "A fast signature scheme based
on quadratic inequalities", IEEE Symp. on theory of
Computing, 1984.

As described so far, according to the present
invention, an accounting apparatus and an accounting
10 system solving the above conventional problems (1) to
(3) of multi-media networks can be realized.

Each user can rent at low cost a variety piece of
information while protecting privacy. An information
provider can receive charges in accordance with a user
15 occurrence frequency of provided information, without
the management of use of provided information of each
user by the information provider. By incorporating a
charge distributor including retail shows and a charge
accommodating person, an accounting system with charge
20 payment function easy to use can be configured.

Many widely different embodiments of the present
invention may be constructed without departing from the
spirit and scope of the present invention. It should
be understood that the present invention is not limited
25 to the specific embodiments described in the
specification, except as defined in the appended
claims.

WHAT IS CLAIMED IS:

1. An accounting apparatus comprising:

input means for inputting money information
indicating an amount of money; and

5 judging means for judging the money information
input from said input means and outputting a permission
signal for permitting a use of information provided by
an information provider.

10 2. An apparatus according to claim 1, wherein
said judging means judges the money information in
accordance with the money information and use charge
information added to the provided information.

15 3. An apparatus according to claim 1, wherein
said money information is cash.

20 4. An apparatus according to claim 1, wherein
said money information is recorded in a recording
medium.

5. An information receiving apparatus for
receiving information provided by an information
provider, comprising:

25 input means for inputting money information
indicating an amount of money; and
judging means for judging the money information

input from said input means and outputting a permission signal for permitting a use of information provided by an information provider.

5 6. An information receiving apparatus according to claim 5, wherein said judging means judges the money information in accordance with the money information and use charge information added to the provided information;

10 7. An information receiving apparatus according to claim 5, wherein said money information is cash.

15 8. An information receiving apparatus according to claim 5, wherein said money information is recorded in a recording medium.

20 9. An information receiving apparatus according to claim 5, further comprising communication means for transmitting use information of the provided information.

25 10. A communication system comprising:
an information provider terminal for providing
information;

a user terminal for receiving and using
information provided by said information provider

terminal; and

an accounting unit inputted with money information and having judging means for judging the input money information, and outputting a permission signal for
5 permitting a use of information provided by an information provider.

11. A communication system according to claim 10,
10 wherein said judging means judges the money information in accordance with the money information and use charge information added to the provided information.

12. A communication system according to claim 10,
15 wherein said money information is cash.

13. A communication system according to claim 10,
wherein said money information is recorded in a recording medium.

14. A communication system according to claim 10,
20 further comprising communication means for transmitting use information of the provided information.

15. A communication system according to claim 14,
25 further comprising a charge distributor terminal for transmitting charge distribution information to said information provider terminal in accordance with the

use information.

16. A communication system according to claim 14,
further comprising a charge accommodating terminal for
5 performing accommodation of a use charge of the
provided information in accordance with the use
information.

17. A communication system according to claim 10,
10 wherein cipher communication is performed between said
terminals.

18. A device in operation with a terminal from
which a user uses information provided from an
15 information provider, comprising:

means for inputting first data indicating an
amount of money;

means for inputting second data regarding the
information provided from the information provider; and
20 judging means for judging whether a use of the
information at the terminal can be permitted or not, in
accordance with the first and second data,

wherein said judging means transmits the judgement
result of a use permission to the external of the
25 device.

19. A device according to claim 18, wherein said

second data includes a use charge, and said judging means judges a use permission of the information by comparing the amount of money and the use charge.

5 20. A device according to claim 18, wherein said first data includes data indicating the type of a recording medium in which said first data is recorded, and said judging means judges a use permission of the information in accordance with the data indicating the type.

10

21. A device according to claim 18, further comprising means for rewriting the amount of money in response to a judgement operation of said judging means.

15

22. A device according to claim 18, further comprising means for outputting a use state of the information to the external of the device in response to a judgement operation of said judging means.

20

23. A device according to claim 22, further comprising means for rewriting the amount of money in response to a judgement operation of said judging means, and means for notifying a use state of the information to the external of the device, synchronously with the operation of said rewriting means.

25

ABSTRACT OF THE DISCLOSURE

A communication system and accounting apparatus are provided capable of easy management of accounting a use of information by a user in multi-media networks while protecting privacy of the user. As a user input money information to an PPC input unit of a user terminal, the money information including cash, a pre-paid card, an IC card, and the like, a discrimination unit judges a use permission of provided information in accordance with the money amount indicated by the money information and/or charge information added to the information provided by an information provider. In response to a user permission signal, a signal processing unit processes the provided information and supplies it to the user.

**COMBINED DECLARATION AND POWER OF ATTORNEY
FOR PATENT APPLICATION**

As a below named inventor, I hereby declare that:

My residence, post office address and citizenship are as stated below next to my name;

I believe I am the original, first and sole inventor (if only one name is listed below) or an original, first and joint inventor (if plural names are listed below) of the subject matter which is claimed and for which a patent is sought on the invention entitled ACCOUNTING APPARATUS, INFORMATION RECEIVING APPARATUS, AND COMMUNICATION SYSTEM

☐ is attached hereto. ☒ was filed on September 4, 1996 as Application
Serial No. 08/706,491

and was amended _____ (if applicable).

I hereby state that I have reviewed and understand the contents of the above identified specification, including the claims, as amended by any amendment referred to above.

I acknowledge the duty to disclose information which is material to the examination of this application in accordance with Title 37, Code of Federal Regulations, §1.56(a).

I hereby claim foreign priority benefits under Title 35, United States Code, §119 of any foreign application(s) for patent or inventor's certificate listed below and have also identified below any foreign application for patent or inventor's certificate having a filing date before that of the application on which priority is claimed:

| Country | Application No. | Filed (Day/Mo./Yr.) | Priority Claimed (Yes/No) |
|---------|-----------------|---------------------|---------------------------|
| Japan | 7-227843 | 5 September 1995 | Yes |

I hereby appoint Joseph M. Fitzpatrick (Registration No. 17,398), Lawrence F. Scinto (Registration No. 18,973), William J. Brunet (Registration No. 20,452), Robert L. Baechold (Registration No. 20,860), John A. O'Brien (Registration No. 24,367), Nels T. Lippert (Registration No. 25,888), John A. Krause (Registration No. 24,613), Henry J. Renk (Registration No. 25,499), Peter Saxon (Registration No. 24,947), Anthony M. Zupic (Registration No. 27,276), Charles P. Baker (Registration No. 26,702), Stevan J. Bosses (Registration No. 22,291), Edward E. Vassallo (Registration No. 29,117), Ronald A. Clayton (Registration No. 26,718), Lawrence A. Stahl (Registration No. 30,110), Laura A. Bauer (Registration No. 29,767), Leonard P. Diana (Registration No. 29,296), David M. Quinlan (Registration No. 26,641), Nicholas N. Kallas (Registration No. 31,530), William M. Wannisky (Registration No. 28,373), Lawrence Alsaburda (Registration No. 31,583), Lawrence S. Perry (Registration No. 31,865), Robert H. Fischer (Registration No. 30,051), Christopher Philip Wrist (Registration No. 32,078), Gary M. Jacobs (Registration No. 28,861), Michael K. O'Neill (Registration No. 32,622), Bruce C. Haas (Registration No. 32,734), Scott K. Reed (Registration No. 32,433), Scott D. Malpede (Registration No. 32,533), John A. Mitchell (Registration No. 19,032), Fredrick M. Zallow (Registration No. 32,452), Richard P. Bauer (Registration No. 31,588), Eric B. Janofsky (Registration No. 30,759), Warren E. Olsen (Registration No. 27,290), Abigail F. Cousins (Registration No. 29,292), Alan W. Fiedler (Registration No. 33,690), Jennifer A. Tegfeldt (Registration No. 31,310), Steven E. Warner (Registration No. 33,326), Thomas J. O'Connell (Registration No. 33,202), Aaron C. Doditch (Registration No. 33,865), Penina Wolfman (Registration No. 30,816), David L. Schaeffer (Registration No. 32,716), Jack S. Cubert (Registration No. 24,245), Mark A. Williamson (Registration No. 33,628), John T. Whelan (Registration No. 32,448), Patricia M. Drost (Registration No. 29,790), Jean K. Dudek (Registration No. 30,938), Raymond R. Mandra (Registration No. 34,332) and Dominick A. Conde (Registration No. 33,856), my attorneys to prosecute this application and to transact all business in the Patent and Trademark Office connected therewith.
